

CISCO NETWORK SECURITY

PROTECTION FOR YOUR RESOURCES AND NEW POSSIBILITIES FOR YOUR STAFF

Modern technology lets traditional company boundaries visibly disappear. Although this development offers enormous potential, it nonetheless entails massive challenges. New mobile devices are being released at a record pace and employees want to use them both in and outside the office. Despite all the new benefits offered by these new mobile devices, they also represent a real threat to company data security. Different levels of access authorisation have to be defined for guest users, subcontractors, staff and partners, and threats from hackers, botnets, spam, phishing, trojans and viruses also have to be accounted for.

Cisco SecureX architecture

The Cisco SecureX architecture with Cisco solutions and services, such as Cisco TrustSec, AnyConnect, Cisco Adaptive Security Appliances (ASA) and the Security Intelligence operations makes comprehensive protection of your own network possible—from mobile staff through to virtualised computer centres—by consistently applying policy-based rules. Using Cisco SecureX architecture you can determine which users from which site, at which point and with which application and which device have access to which content.

Cisco SecureX architecture offers your company the following benefits:

- Lower risks; new threats are quickly identified and reacted to accordingly
- Better compliance: company policies and best practices are applied effectively and efficiently
- Lower operating costs: the system works more efficiently, is less complex and costs less
- Greater transparency: the system adapts to the new threats as soon as they arise
- Universal coverage: security functions are integrated into all the devices connected to the network.

With Cisco SecureX architecture the security infrastructure of companies works more accurately, more effectively and always uses the latest information on threats.
